River study

The students studied how the river changes through the year. They collected water samples each week and compared their results with earlier records. This report describes the methods and explains why the findings matter for the people who live near the river. The researchers need to do further work before they can draw firm conclusions.

Water samples: *2026*

1. Water samples

Water samples	12
Second sampling site	8

$x = 2$

Observation

Observation[1i]

Quoted evidence.

To compare the results, the students collected 12 samples on 5 March 2026. Smith (2024) reports that “the river is stable”. The measurements are listed at https://example.org/study. They used the same method for each sample and kept their notes for the next study. The report does not establish why the river changed.

a. Compare the second sample
